PROFESSIONAL SUMMARY

Senior Application Software Engineer at Oracle with over 4 years of experience in enterprise B2B integration. Delivered platform redesign features, support for six X12 EDI transaction sets, and more than 10 SOAP-to-REST migrations. Skilled in Java, SQL, UI development, Selenium/KWik automation, performance optimization, and reliable messaging, with experience in code/design reviews and mentoring. B.E. in Computer Science from BITS Pilani, Hyderabad Campus.

PROFESSIONAL EXPERIENCE

ORACLE *(Total Experience: 4 Years, 3 Months)* **Hyderabad, India**

Senior Application Software Engineer *Sep 2024 – Present*

- **Implemented Collaboration Messaging Framework Gen 2** (CMK) UI, setup data retrieval, and message processing for a complete, backward-incompatible redesign, reducing customer setup from four entities—service provider, trading partner, business process, and application partner—to two: provider and connection, simplifying onboarding.
- **Designed and implemented end-to-end support** for six X12 EDI transaction sets (850, 855, 856, 810, 940, 945) in CMK, including 940/945 warehouse shipping instructions and confirmations for automotive customers, enabling automated procurement, fulfillment, and invoicing exchanges with trading partners.
- **Implemented automated processing acknowledgments** in CMK to notify trading partners of success or failure and prevent unnecessary retries, reducing the number of customers reporting unknown message status by approximately 40–50%.
- **Migrated more than 10 backend service integrations** from SOAP to REST in CMK, reducing SOAP dependencies and simplifying maintenance of customer integrations.
- **Increased automated UI test coverage** by nearly 20 additional pages using Selenium and KWik; automated test-case generation and verification for future enhancements, reducing validation time by approximately 50% and strengthening regression detection.
- **Mentored** junior engineers through onboarding, knowledge sharing, and code/design reviews, and performed root-cause analysis, contributing to a 30% reduction in defects reported by QA and customers.

Application Software Engineer *Jul 2022 – Aug 2024*

- **Rewrote SQL queries** and denormalized transaction-viewer data, reducing load time from approximately 20–30 seconds to near-instant responses so customers can monitor status and troubleshoot B2B messages faster.
- **Built backend auto-retransmission** to detect untransmitted messages and recover delivery with exponential backoff, a limit of 5 attempts, and customer-configured schedules, reducing manual recovery after temporary service failures.
- **Resolved defects** and addressed technical debt, contributing to a team's 50% reduction in the combined backlog from 1,200 to 600 items, improving maintainability and customer transaction reliability.
- **Built an Oracle APEX dashboard** tracking monthly customer counts, feature adoption, message volumes, document types, and failure rates for about 600 customers to guide product managers' planning and developers' failure analysis.

INTERNSHIPS

AMAZON | Software Development Intern **Jan 2022 – Jun 2022**

- **Enhanced a global seller portal** with React/JavaScript frontend features and Java backend services to support cross-border exports; implemented A/B tests to evaluate UI changes and inform improvements to the seller experience.
- **Authored unit tests and documentation** to support reliable code changes and help future engineers understand, maintain, and extend the seller portal.

ORACLE | Project Intern **Jun 2021 – Jul 2021**

- **Developed an Oracle JET application** to visualize XSL transformations and field mappings between XML documents, supporting text inputs and file uploads to help developers inspect transformation logic.
- **Built a Java Jersey REST API** to validate JSON payloads against business rules, accept file uploads through POST requests, and return detailed validation feedback to help developers identify input errors.

IGCAR (Indira Gandhi Centre for Atomic Research) | Intern **May 2020 – Jun 2020**

- **Developed a JavaFX application** with a MySQL backend to store and retrieve reactor fuel data; optimized SQL queries and added graphical and tabular views to support data analysis.
- **Implemented login and authentication** to restrict access to reactor fuel data to authorized personnel.

TECHNOLOGIES

Languages & APIs: Java, SQL, Python, JavaScript, HTML, REST, SOAP. **B2B:** CMK, X12 EDI, OAGIS, cXML.
Tools & Platforms: Oracle APEX, Oracle JET, React, JavaFX, Java Swing, Selenium, KWik, Oracle DB, MySQL, Git.

EDUCATION

BITS PILANI, HYDERABAD CAMPUS | B.E. in Computer Science **2022**

CGPA: 9.0/10.0 | Coursework: Data Structures, Algorithms, Distributed Systems, DBMS.

ST. MICHAEL'S HIGH SCHOOL, PATNA (CBSE XII: 94%) | DAV PUBLIC SCHOOL (CBSE X: 10/10 CGPA) **2018 | 2016**
